

CASES

Must be isolated for a minimum of 10 days after onset and can be released after afebrile and feeling well (without fever-reducing medication) for at least 72 hours.

Asymptomatic cases must be isolated for 10 days after their specimen collection date.

Note: If a follow-up PCR test is positive, cases do not need to re-enter isolation as long as they have completed the minimum 10 day isolation and had symptom resolution for a minimum of 72 hours.

Note: Lingering cough should not prevent a case from being released from isolation.

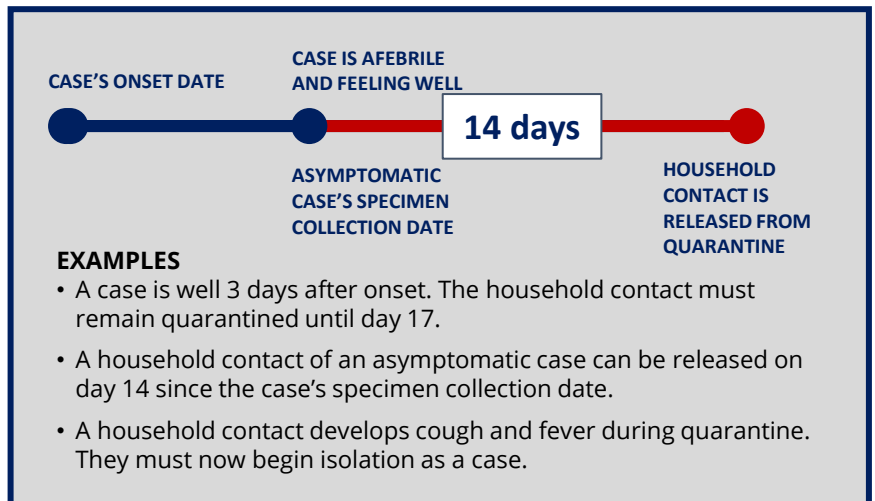

HOUSEHOLD CONTACTS

Must be quarantined for 14 days after the case has been afebrile and feeling well (because exposure is considered ongoing within the house).

If a household contact develops compatible symptoms, they become a case. They should begin isolation and consider getting tested.

If the case is asymptomatic, the household contact must quarantine for 14 days after the case's specimen collection date.

Note: Household contacts may need to remain at home longer than the initial case.

NON-HOUSEHOLD CONTACTS

Must be quarantined for 14 days from the date of last contact with the case while the case was ill.
